

Power Plant and Boiler Technology since 1985

Rantotek's core competences are boiler plant technology and combustion process know-how. We supply everything from engineering to commissioning for boiler projects (EPCM), including concept definition, combustion and performance engineering, pressure part calculation and design, procurement engineering and assistance, site supervision and commissioning.

Our clients are end users of power plants and builders of boilers and power plants around the world. One of our special skills is our know-how of the Pressure Equipment Directive (PED) and ASME as well as many other national standards.

The highly skilled personnel with expertise acquired over many years forms the backbone of our company and ensures that all projects are carried out to the highest standards.

In addition to new boilers we have carried out several modernization projects for power and recovery boilers. These retrofits include increasing power output and improving combustion processes.

Rantotek is part of Comatec Group, which is a leading engineering company specialised in machine and equipment design offering ideation and concept services, project management, as well as design and expert services for industry needs.
